

Oasis Infobyte – Cybersecurity Internship

Task 5 – Social Engineering Attacks

This folder contains my completed Task 5 work for the Oasis Infobyte Cybersecurity Internship. The task focuses on understanding social engineering attacks, how attackers manipulate people, and practical ways to recognize and prevent these attacks.

Objective

The objective of this task is to study common social engineering techniques and understand how attackers use trust, urgency, fear, curiosity, or authority to influence victims into revealing information or performing unsafe actions.

Topics Covered

- Phishing – deceptive messages or websites used to obtain information.
- Spear phishing – targeted phishing aimed at a specific person or organization.
- Pretexting – creating a believable false situation to obtain information.
- Baiting – using an attractive offer or object to encourage an unsafe action.
- Impersonation – pretending to be a trusted person or organization.
- Tailgating – gaining unauthorized physical access by following an authorized person.

Key Prevention Measures

- Verify unexpected requests before responding or sharing information.
- Do not open suspicious links or attachments.
- Check sender addresses, URLs, and message details carefully.
- Use strong, unique passwords and multi-factor authentication.
- Avoid sharing sensitive information without confirming the recipient.
- Report suspicious messages or incidents through the appropriate channel.

Repository Contents

File	Purpose
Task-5-Social-Engineering-Report.pdf	Detailed task report
README.md	Short explanation of the task and work completed
Evidence / screenshots	Supporting practical evidence, where applicable

Conclusion

This task improved my understanding of the human side of cybersecurity. Social engineering attacks can bypass technical controls by manipulating people, so awareness, verification, and careful handling of information are important parts of cybersecurity.

Prepared as part of the Oasis Infobyte Cybersecurity Internship.
