

Task 4 – Common Network Security Threats

Oasis Infobyte Cybersecurity Internship

Introduction

This task covers common threats that can affect networks and connected systems. The report looks at how different attacks can affect confidentiality, integrity and availability, and the basic security measures that can reduce their impact.

Topics Covered

- Malware
- Phishing
- Denial-of-Service (DoS) and Distributed Denial-of-Service (DDoS)
- Man-in-the-Middle attacks
- Password attacks
- Application-based threats
- Insider threats
- Zero-day vulnerabilities

Prevention and Best Practices

- Keep operating systems and applications updated.
- Use strong, unique passwords.
- Enable multi-factor authentication.
- Use firewalls and endpoint protection.
- Maintain regular backups.
- Encrypt sensitive communications.
- Train users to recognize suspicious messages.
- Monitor systems for unusual activity.

What I Learned

The main lesson from this task is that network security needs multiple layers of protection. A single security control cannot protect an organization from every type of threat. Technical controls, secure configuration, regular updates and user awareness all need to work together.

Report

The complete report is available in **Task_4_Network_Security_Threats_Report.pdf**.

Purpose

This work was completed as part of the Oasis Infobyte Cybersecurity Internship for educational and practical learning.
